ZYRO WhatsApp — How to Achieve Both Reliability and Simplicity

I understand your concern. ZYRO is intended to become a serious business automation platform, and businesses will depend on it for customer communication, order confirmations, delivery updates, and sales.

My recommendation is:

Meta WhatsApp Cloud API + Embedded Signup + WhatsApp Business App Coexistence + Next.js/Vercel + Supabase.

This gives you an officially supported messaging infrastructure, while allowing eligible merchants to continue using their existing WhatsApp Business app.

There is one tradeoff: the first connection may involve Meta authorization and verification, not just scanning a Linked Devices QR code. We can make the experience guided and simple, but we cannot legitimately eliminate every Meta-required step.

1. The feature that changes everything: WhatsApp Coexistence

This is the feature I would prioritize for ZYRO.

With Coexistence, an eligible business can use the same WhatsApp number in both its existing WhatsApp Business app and your ZYRO inbox.

Customer's WhatsApp Business Number

One business identity, one phone number

WhatsApp Business App

Merchant continues chatting on their phone

ZYRO Inbox

Staff manage supported conversations, orders and automation

Official Meta Cloud API

Meta hosts the messaging infrastructure and sends events to ZYRO

Coexistence can support history synchronization and message echoes between the business app and Cloud API. This is much closer to the WhatsApp-like experience you want than a basic Cloud API connection. Exact synchronization coverage and eligibility still need testing.

2. How easy can onboarding become?

Connect WhatsApp to ZYRO

Official integration

1. Connect existing WhatsApp Business

Customer clicks the connection button

2. Authorize with Meta

Log in, select/create business portfolio, verify the number as required

3. Scan onboarding QR

Use the WhatsApp Business app when the Coexistence flow presents a QR

4. Start using ZYRO

ZYRO completes setup automatically and activates the inbox

The official Coexistence onboarding documentation describes a QR-assisted process, optional history sharing, and continued use of the existing WhatsApp Business app.

Client Documentation

This is not the standard Linked Devices QR, and the user may need a Meta login and number verification. But the user does not need to know what an API token, WABA ID, webhook, or Phone Number ID is.

3. Two ways to implement this in ZYRO

	Direct Meta integration	**Official WhatsApp partner**
Infrastructure	Vercel + Supabase	Vercel + Supabase
Meta App	ZYRO manages it	Partner-specific setup
Onboarding	Embedded Signup	Partner-assisted Embedded Signup
Coexistence	Subject to approved access	Subject to partner support

API maintenance	ZYRO	Shared with partner
Messaging charges	Meta charges	Meta + possible partner fees
Long-term control	Higher	Depends on contract

Option A — Become a Meta Tech Provider

This is my preferred long-term model.

ZYRO creates its Meta Developer App, completes the necessary reviews and approvals, and implements Embedded Signup.

Meta explicitly supports Tech Providers onboarding customer businesses and managing their WhatsApp integrations.

Postman API Network+1

You own the integration architecture and avoid depending on a third-party WhatsApp Web session provider.

Option B — Work with an official WhatsApp partner

This is potentially the faster route if Meta approvals or Coexistence setup become difficult.

For example, 360dialog documents Coexistence onboarding with QR verification and chat-history synchronization.

Client Documentation

Other official business messaging providers can be evaluated, but you should explicitly verify that they support:

- WhatsApp Business App Coexistence for your target merchants in Pakistan.
- Self-service onboarding inside ZYRO, not only inside the provider's dashboard.
- Multi-tenant account management and inbound/outbound message webhooks.
- History synchronization, message echoes, and commercial resale terms.

The partner must confirm these capabilities in writing before you build around them.

4. Your existing technical stack is already suitable

You do not need a Railway worker for official Cloud API messaging.

ZYRO component	Responsibility
Next.js / Vercel	Embedded Signup, send API, webhook endpoints

Supabase Auth	Merchant authentication
Supabase PostgreSQL	Connections, conversations, messages
Supabase Realtime	Live inbox updates
Supabase Storage	Media attachments
Redis	Optional caching, rate limits and queueing
Meta Cloud API	WhatsApp delivery and connection management

Your single webhook endpoint receives events for all authorized merchants, verifies Meta's signature, identifies the tenant by Phone Number ID, and stores the event in Supabase.

Build the message ingestion path to handle `messages`, status events, Coexistence history events, and `smb_message_echoes` where available. That allows the ZYRO inbox to reflect supported messages sent from the merchant's WhatsApp Business app as well.

Bizgate Documentation

You will also need to implement WhatsApp's 24-hour customer-service window, approved message templates, opt-in requirements, and applicable messaging charges. Official API access does not mean unlimited free-form messaging.

5. My proposed ZYRO implementation roadmap

Phase 1 — Confirm Meta eligibility

Create or prepare ZYRO's Meta Business Portfolio and Developer App. Begin the Tech Provider and App Review process, including the necessary messaging permissions.

Verify that Coexistence onboarding is available for your target Pakistani businesses.

Phase 2 — Build a real onboarding prototype

Use one eligible WhatsApp Business test number. Complete the Meta authorization and QR-assisted onboarding, then verify that the number remains usable in the WhatsApp Business app.

Phase 3 — Implement two-way messaging

Receive messages through webhooks, reply from ZYRO, test message echoes, import available history, and display everything through Supabase Realtime.

Phase 4 — Multi-tenant onboarding

Implement automatic account mapping, encrypted tenant credentials, connection monitoring, retries, billing visibility, and an easy reconnection/support flow.

6. One important thing to verify early

Because ZYRO will serve Pakistani ecommerce businesses, I would test these exact scenarios before making any customer promises:

- A merchant already using WhatsApp Business on an Android phone connects their number.
- Their existing chats remain accessible on the phone.
- A new customer message appears in ZYRO.
- A reply sent through ZYRO appears in the customer's WhatsApp.
- A message sent from the merchant's phone is reflected in ZYRO.
- The integration remains active after Vercel deployments and browser closures.

Coexistence has eligibility and feature limitations, including some restrictions around linked devices, history synchronization, and account migration.

Client Documentation+1
These should become part of your onboarding compatibility checks.
